INTRODUCTION

During the ten-year operation of the Regional archaeological project Uaxactun (Proyecto Arqueológico Regional PARU), dozens of important findings of various origins have been collected. PARU is an international and multidisciplinary scientific project whose main objective is to increase the knowledge of one of the most important Maya sites, Uaxactún, as well as the surrounding sites of the Valle de Azúcar zone. During the period from the beginning of the project until the time of the photography (2009-2019), it was possible to collect many ceramics in different states of preservation. Thus, from shards and partially preserved vases or plates to completely preserved ceramic objects. These have been carefully cleaned and documented. However, high-quality catalogue photographs were only taken during the field research in 2019. The ceramic objects were deposited in three different locations namely - Ceramoteca in the capital city of Guatemala City, in the project laboratory in the village of El Remate and finally in the on-site laboratory, i.e. at the Uaxactún site. The subjects were photographed under artificial lighting conditions, i.e. in a diffuse photo booth that had its own LED lighting.

A total of 122 pieces of pottery in various states of preservation were photographed. 63% of vases, cups and plates were preserved in complete condition. Many of these contained important decorations and preserved shapes that help us learn about the motivations of Maya artists and craftsmen. Some even display preserved hieroglyphic writing that is not in the form of pseudoglyphs.

The most important artifacts from the pottery series were also processed using photogrammetry, which then allowed the creation of a digital model in a computer environment. Thanks to this, we can examine the details of vases or plates even in domestic working conditions.
